

Pricing algorithm detected and applied

Formula: $\text{price}_{10} = \text{base_family} \times \text{security_level} \times \text{standard_premium} \times \text{rarity} \times \text{complexity} \times \text{entropy_factor}$.

Base family: symmetric/hash/token families are lower; PQC, ZK, MPC, FHE, ABE and advanced HSG2818 profiles are higher.

Security level: 128/192/256-bit, L1/L3/L5 and 640-896-bit metadata raise or lower the pack price.

Standard premium: NIST/FIPS/RFC/ISO and signed/verified profiles get higher confidence value; deprecated legacy items are discounted.

Rarity and complexity: uncommon families, HMAC binding, salt/nonce, routes, signatures and post-quantum functions increase price.

Total priced codes: 10,000. Currency: USD. Unit: price per single code and per pack of 10 codes.

This catalog is a product-pricing model for HSG2818 services. It is not a market quote, legal valuation, or financial advice.

Columns

IDX: global code number in the 10,000-code catalog.

CODE: HSG2818 variant or primitive name.

FAMILY: detected cryptographic pricing family.

ENTROPY/STANDARD: metadata used by the pricing algorithm.

1 CODE / 10 CODES: suggested service price.
